Types of Selection
Write a short scenario that would result in the following graphs (one for each graph). Be sure to label the type of selection for each graph.

Organisms with "medium" characteristics are more fit.
- Scales too heavy → Can't move fast enough → Die
- Dragons that have medium weigh scales
- Scales too light → Easy to kill

Organisms on one extreme do better.
- Dragons that blow lots of fire survive
- A little fire that is unpredictable
- Not enough → Die

Both extremes are fit.
- Big dragons have fire so they can protect themselves
- Too big to hide & No fire so no protection → Die
